and save your clients.**

mailrevive 

How MailRevive™ works for ASP Partners.

- Integrated messaging services
- Scalable pricing model
- No infrastructure costs
- Dedicated web-services
- Automated monthly reporting
- Online customer provisioning

Deliver these key messaging services to your clients.

- Email eDiscovery** - MailRevive™ allows end-users and network administrators to perform accurate real-time search of the live messaging archive, while integrated eDiscovery tools allow corporate, regulatory and even legal eDiscovery requests to be executed online, saving your business time and money.
- Active Email Archiving** - MailRevive™ active email archiving fully automates the indexing of email, saving employees time and mitigating the risk of human error in email retention policies. Through an asynchronous indexing process the flow of email remains uninterrupted and email and attachments are archived as recovery ready.
- Storage Management** - MailRevive™ integrates Synetek's proprietary storage technology, SYNestore™, to deliver a highly scalable and cost effective solution for managing increasing volumes of email. Administrators can easily manage the long-term retention of email records by diverting it from a local environment to the fully managed centralised MailRevive™ archive.
- Email Continuity** - MailRevive™ at the gateway includes an integrated corporate webmail that enables a standby email interface for staff. Integrating a corporate webmail ensures employees have continuous access to email records and the ability to send and receive email, even when the Exchange Server is down!
- Email Recovery** - MailRevive™ allows email recovery via a single click, as a recovery attachment, as a PDF, via a date range, or as part of an eDiscovery package. For administrators MailRevive™ also provides a centralised and secure interface for disaster recovery and evidentiary records recovery, across multiple mailboxes and mail servers.
- Email Protection** - MailRevive™ gateway email filtering ensures the security of business' network by eliminating spam and viruses before they reach the firewall. By also integrating on-disk encryption in a fully secure and managed environment companies can have complete email protection from a single IT solution, saving on management time and license fees. (Optional Feature)
